No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Description

Nat. Struct. Biol. 4:788-792(1997).

-I. FUNCTION: Tetamus toxin acts by inhibiting neurotransmitter
release. It binds to peripheral neuronal synapses, is internalized
and moves by retrograde transport up the axon into the spinal cord
where it can move between postsynaptic and presynaptic neurons. It
inhibits neurotransmitter release by acting as a zinc
endopeptidase that catalyzes the hydrolysis of the 76-Gln-|-Phe-77
bond of synaptobrevin-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    synaptobrevin 2. COPACTOR: Binds 1 zinc ion per subunit (By similarity). COPACTOR: Binds 1 zinc ion per subunit (By similarity). SUBUNIT: The precursor polypeptide is subsequently cleaved to SUBUNIT: I and H. These remain linked by a disulfide bridge and are non-toxic after separation. MISCELLANEOUS: The C-terminus of the heavy chain binds to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                IDENTIFICATION OF SUBSTRATE.

Rotulinal neurotcoxins and tetanus toxin.";

J. Biol. Chem. 269:12764-12772(1994).

I. FUNCTION: Botulinum toxin acts by inhibiting neurotransmitter release. It binds to peripheral neuronal synapses, is internalized and moves by retrograde transport up the axon into the spinal cord where it can move between postsynaptic and presynaptic neurons. It inhibits neurotransmitter release by acting as a zinc endopeptidase that catalyzes the hydrolysis of the S8-Gln-|-Lys-59 condopeptidase that lamited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. Notested action on small molecule substrates.

I. SUBUNIT: Disulfide-linked heterodimer of a light chain (H). The light chain has the pharmacological activity, while the N and Cterminal of the heavy chain mediate channel cormation and toxin binding, respectively.

I. SUBCELLULAR BOUS: There are seven antigenically distinct forms of condomer of synapsidase family M27.

SIMILARITY: Belongs to peptidase family M27.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. Nucleotide sequence of the gene coding for Clostridium botulinum with other clostridial neurocoxine.

(Clostridium argentinense) type G neurotoxin: genealogical comparison with other clostridial neurocoxine.

1. FORCTION: Botulinum toxin acts by inhibiting neurotransmitter release. It binds to peripheral neuronal synapses, is internalized and moves by retrograde transport up the axon into the spinal cord where it can move between postsynaptic and presynaptic neurons. It

CATALYTIC ACTIVITY: Limited hydrolygis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

COFACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, heavy chain (H). The light chain has the pharmacological activity, formation and coxin binding, respectively.

SUBCELLUNGAR LOCATION: Secreted (By similarity).

MISCELLANEOUS: There are seeven antigenically distinct forms of botulinum neurotoxin: Types A, B, Cl, D, B, F, and G.

SIMILARITY: Belongs to peptidase family M27.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | R | MENCPS; | MAY. | UUU4; | L. | |

heavy chain (H).

-- SUBCELLULAR LOCATION: Secreted.
-- PHARMASCEUTICAL: Available under the name BOTOX (Allergan) for the treatment of strablsmus and blepharospasm associated with dystonia and cervical dystonia. Also used for the treatment of hemifacial spasm and a number of other neurological disorders characterized by abnormal muscle contraction.
-- MISCELLANEOUS: There are seven antigenically distinct forms of botulinum neurotoxin: Types A, B, Cl, D, E, F, and G.
-- SIMILARITY: Belongs to peptidase family M27.
-- SIMILARITY: Belongs to peptidase family M27.

Struct. Biol. 5:898-902(1998).

-! FUNCTION: Inhibits acetylcholine release. The botulinum toxin binds with high affinity to peripheral neuronal presynaptic membrane, is then internalized by receptor-mediated endocytosis. The C-terminus of the heavy chain (H) is responsible for the adherence of the toxin to the cell surface while the N-terminus mediates transport of the light chain from the endocytic vesicle to the cytosol. After translocation, the light chain (L) hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking neurotransmitter release. Inhibition of acetylcholine release results in flaccid paralysis, with frequent heart or respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEDLINE=98455071; PubMed=9783750;

WEDLIATOR OF SUBSTRATE.

Baquora B.R., Montecucco C.;

Tetanus and botulinum-B neurotoxins block neurotransmitter release by proteolytic cleavage of synaptobrevin.";

In Tetanus Base of synaptobrevin.";

In Tetanus Base of synaptobrevin.";

In Tetanus Base of synaptobrevin.";

In Tetanus Base of synaptobrevin.";

In Telease. It binds to peripheral neuronal synapses, is internalized and moves by retrograde transport up the axon into the spinal cord where it can move between postsynaptic and presynaptic neurons. It inhibits neurotransmitter release by acting as a zinc endopeptidase that cleaves the 76-Gln-|-Phe-77 bond of synaptobrevin.

CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

CORACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, while the N. and C-terminal of the heavy chain (H). The light chain mediate channel formation and toxin binding, respectively.

SUBCELLANBOUS: There are seven antigenically distinct forms of botulinum neurotoxin: Types A, B, Cl, D, E, F, and G.

SIMILARITY: Belongs to peptidase family M27.
                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. Virus Res. 53:53-73(1998).
-!- FUNCTION: The VP2 protein is one of the two proteins (with VP5)
which constitute the virus particle outer capsid. It is the major
target of the host immunogenic response.
-!- SIMILARITY: Belongs to the recoviruses VP2 protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Name=S2; Synonyms=L2;

AL Biol Chem. 269:1617-1620(1994).

L. Biol Chem. 269:1617-1620(1994).

C. Lelease. It binds to peripheral neuronal synapses, is internalized and moves by retrograde transport up the axon into the spinal cord where it can move between postsynaptic and presynaptic neurons. It inhibits neurotransmitter release by acting as a zinc endopeptidase that catalyzes the hydrolysis of the 180-Arg-|-11e-catalyzes the hydrolysis of the 180-Arg-|-11e-catalyzes the hydrolysis of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

C. -- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

C. -- CATALYTIC Disulfide-linked hererodimer of a light chain (l) and a heavy chain (H). The light chain has the pharmacological activity, while the N- and C-terminal of the heavy chain mediate channel commation and toxin binding, respectively.

C. -- SUBCELLANEOUS: There are seven antigenically distinct forms of command toxin binding, respectively.

C. -- SUBLILANEOUS: There are seven antigenically distinct forms of command toxin and the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command the command

-!- FUNCTION: Botulinum toxin acts by inhibiting neurotransmitter
release. It binds to peripheral neuronal synapses, is internalized
and moves by retrograde transport up the axon into the spinal cord
where it can move between postsynaptic and presynaptic neurons. It
inhibits neurotransmitter release by acting as a zinc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

COPACTOR: Binds I zinc ion per subunit (By similarity).

SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, while the N- and C-terminal of the heavy chain mediate channel formation and toxin binding, respectively.

SUBCELULIAR LOCATION: Secreted.

MISCELLANEOUS: There are seven antigenically distinct forms of botulinum neurocoxin: Types A, B, Cl, D, B, F, and G.

SIMILARITY: Belongs to peptidase family M27.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    "Cloning of a DNA fragment encoding the 5'-terminus of the botulinum type E toxin gene from Clostridium butyricum strain BL6340."; J. Gen. Microbiol. 137:519-525(1991).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE=91237316; PubMed=2033376; Füjil N., Tauzuki K., Yokosawa N., Fujil N., Kimura K., Murakami T., Indoh T., Tauzuki K., Yokosawa N., Yashiki T., Oguma K.; "Cloning of a DNA fragment encoding the 5'-terminus of the botulinum

It can be used as a universal carrier for the prepn. of an immunogenic conjugate. It is covalently bound to a peptide or polysaccharide hapten derived from a pathogen. This conjugate can be used as a vaccine for malaria. This peptide is recognised by different T- helper cell clones in association with alleles of the human MHC. It contains 2 epitopes: (a) 953-967, recognised by DR-restricted clones; and (b) 947-960, recognised by all other DR and DP- restricted clones. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 27-MUG-2003 to correct PI field.) (Updated on 24-0CF-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This T-cell antigen TT3 peptide may be attached to a core peptide contained in one of the 2 subunits of an alpha-helical coiled-coil heterodimer. Each core peptide is comprised of terminal and internal AA repeat sequences. This peptide antigen is attached to the core peptide through covalent linkages to certain AA of the internal repeats. The 2 subunits of the heterodimer are arranged in a stable alpha-helical coiled-coil configuration having a 1:1 stoichiometry, and the peptide antigen is disposed toward the outer surfaces of the configuration. The heterodimer may be used as a synthetic vaccine (optionally multivalent) or to generate antibodies
response against endogenous CETP activity, thereby treating or preventing a cardiovascular disease, such as atherosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hetero:dimeric polypeptide immunogen in coiled-coil configuration with different antigens on each sub:unit - useful in vaccines and for antibody

                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a broad range helper T cell epitope of the tetanus protein. It can be used in DNA plasmid-based vaccines against cholestery! ester transfer proteins (CETPS). CETPS mediate the transfer of cholestery! ester from high density lipoprotein (HDL) to very low versa. An increased CETP activity produces an atherogenic lipoprotein profile and induces atherosclerosis. A DNA plasmid-based vaccine comprises sequences encoding at least one B cell epitope of CETP linked in frame with at least one segment encoding a broad range helper T cell epitope. The vaccines can be used to elevate the ratio of circulating HDL to circulating LDL, VLDL or tocal cholesteric in a human. It can also be used for decreasing the level of endogenous CETP activity in a human. The brashing can be used to produce anti-CETP antibodies in vivo and for

```
The invention relates to a new carbohydrate peptide conjugate, which comprises a carrier with a dendrimeric poly-lysine enabling multiple comprises to be covalently attached to it. Also claimed are: (1) an antibody purified from biological fluid or cells of organisms cambody purified from biological fluid or cells of organisms of administered with the carbohydrate peptide conjugate, and (2) a diagnosis of the carbohydrate peptide conjugate. The peptide conjugate, antibody and carbohydrate peptide conjugate. The peptide conjugate antibody and conjugate is against thunurs. These can be used to support an immune response of vaccines against the same and the peptide conjugate in manner response capinst viral infections caused by hepatitis virus, HIV or cytomegalo virus. They can be used to enhance immune responses, especially B- and T-CC carbohydrate peptide conjugate stimulates the antibody and T-cell carbohydrate peptide conjugate stimulates the antibody and T-cell casponse without stimulating undesired immune responses. The composition conspiculating to this sequence may be used to animals. The present sequence corresponds to residues 947-967 of tetanus conting the survival of tumour bearing humans and conjugate corresponding to this sequence may be used to an epitope in a carbohydrate peptide conjugate conjugate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Carbohydrate peptide conjugate used as vaccine - comprises carrier with dendrimeric poly-lysine enabling multiple epitopes to be covalently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Chimeric; non-typable Haemophilus influenzae; fimbrin; T-cell epitope; immunogenic composition; immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              T-cell epitope peptide #5 for chimeric fimbrin/T-cell epitope peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
Tetanus toxin; vaccine; antibody; carbohydrate peptide conjugate; dendrimeric poly-lysine; epitope; tumour.

be used in the method of the invention for inducing antibody-dependent cellular cytotoxicity (ADCC) against a tumour cell which is characterised by overexpression of HER 2/neu or epidermal growth factor receptor (BGFR), comprises contacting the tumour cell with a multispecific protein molecule (preferably a single chain antibody comprising; (a) an anti-FC receptor antibody or an antigen binding fragment; (b) a portion which binds to HER 2/neu; and (c) a portion which binds to HER 2/neu; and (c) a portion which binds to EGFR. The method can be used for treating cancers especially breast cancer or ovarian cancer. The multispecific antibody can also be administered prophylactically to vaccinate a subject against infection by a target cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The claims detail a method for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (i.e. self-proteins), for example, human prostate specific membrane antigen (PSW), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGP8b). The method comprises effecting simultaneous presentation by antigen producing cells (APC8) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSW, human Her2 and human/murine FGP8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     associated peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Foreign epitope, P2; prostate specific membrane antigen, PSM, Her2; Heregulin 2; Fibroblast growth factor 8b; FGF8b; vaccination; eytotoxic T-lymphocyte immunity; self-protein; cancer; breast cancer; prostate cancer; cell-associated peptide antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Haaning J, Leach D,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                 The invention relates to the manufacture of a synthetic chimeric peptide comprising a non-typable Haemophilus influenzae fimbrin peptide fused via
                                                                                                                                                                                                                                                                                                                                                                                                       a linker peptide to a T-cell epicope peptide. The chimeric peptide is used in immunogenic compositions which induce an immune response against non-typable Haemophilus influenzae. This sequence represents an example of a T-cell epitope peptide used to generate the chimeric peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Multispecific single chain antibody; antibody H22; tumour cell; therapy; antibody-dependent cellular cytotoxicity; ADCC; HER 2/neu; infection; epidermal growth factor receptor; breast cancer; ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a tetanus toxoid epitope and is recognised by the multispecific single chain antibody designated H22. The antibody can
                                                                                                                                                                                                                                                         Synthetic chimeric fimbrin peptide - useful for vaccination against non-
typable Haemophilus influenzae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Specific killing of tumour cells - using a multi-specific molecule comprising an anti-Fc receptor antibody and a portion which binds to target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 21;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a tetanus toxin T cell epitope known as Helper Peptide P30. Hybrids of this peptide and an immunogenic peptide derived from tumour rejection antigen precursor MAGE-10 were used to generate polyclonal antiserum against MAGE-10. MAGE-10 binding monoclonal antibodies can be used to detect MAGE-10. Expression. A correlation between MAGE-10 expression and canner has been discovered and thus by determining the presence of MAGE-10, the presence of cancer can be determined. MAGE-10 expression can be detected using an immunoassay, an oligonuclectide hybridisation assay or via other standard techniques. This method is especially useful for determining the presence of bladder, ossophageal, head and neck, prostate or lung cancer, or melanoma, myeloma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Determining presence of cancer in samples, especially useful for detecting bladder, prostate and lung cancer comprises assaying sample for expression of tumor rejection antigen precursor MAGE-10.
epitope (e.g. P2 and/or P30) are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively
                                                                                                                                                             Gaps

The present sequence represents the tetanus toxoid P30 epitope. It is used to create a fusion protein with murine osteoprotegerin ligand (OPGL). Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL polypeptides are 87% nomologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OPGL activity in an animal. The method comprises using at least one OPGL polypeptide or subsequence, and/or at least one OPGL polypeptide are useful for treating, preventing and ameliorating content of optic polypeptide are useful for treating, preventing and ameliorating contents of the conditions characterised by excessive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                        proteins and their coding sequences to down regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides carrier proteins comprising at least 5 CD4+ T cell epitope. The carrier protein comprises at least 1 of N6, N10 or N19. The carrier protein can be prepared by expressing a vector comprising a nucleic acid molecule encoding the protein, in a host cell and recovering the expressed protein. The carrier protein can also be produced by (a) constructing oligonucleotide molecules that encode peptide epitopes; (b) annealing the oligonucleotide molecules that encode peptide epitopes; (b) duplexes into an expression vector; (d) introducing the expression vector into a host cell; and (e) isolating the fusion protein produced from a culture of the host cells. The carrier protein can be used as a protective immunogen in the control of diseases caused by encapsulated bacteria. Sequences AAY49256-266 represent CD4+ T cell epitopes inserted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Carrier proteins containing CD4+ epitopes useful for protecting against diseases caused by encapsulated bacteria.

The invention relates to a method for in vivo down-regulation of amyloid protein such as beta amyloid (Abeta) in an animal, including human. The method comprising presenting to the animal's immune system an immunogenically effective amount of at least one amyloidogenic protein or its subsequence and/or at least one analogue of the amyloidogenic protein or its subsequence, and its polypeptide. The amyloidogenic protein or its subsequence, and its analogue is useful for the preparation of an immunogenic composition comprising an adjuvant for down-regulating amyloid in an animal. They are also useful in the treatment, prophylaxis or amelioration of Alzheimer's disease or other diseases characterised by amyloid deposits. They are also useful in the treatment of systemic amyloidosis, maturity onset dementia, amytorophic lateral sclerosis (ALS), pick's disease and prionrelated transmissable spongiform encephalopathies. They are also useful for inducing production of antibodies against an amyloidogenic property.
subsequence and/or at least one analogue of the amyloidogenic polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Amyloid disease, amyloid fibril deposition, amyloid plaque; immunogenic; antibody; vaccine; Alzheimer's disease; type 2 diabetes; reactive system amyloidosis; systemic senile amyloidosis; familial amyloid cardiownypathy; transmissible spongiform encephalopathy; creuzzfeld-Jakob disease; Kuru; haemodialysis-asssociated beta-2-microglobulin deposition; carrier protein; universal T-cell epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition comprising immunogen against amyloid component such as fibril peptide or protein, or antibody against amyloid component useful for treating amyloid diseases or amyloidoses.

The invention relates to a novel pharmaceutical composition for preventing or treating a disease characterised by amyloid fibril deposits (amyloid plaques) in a patient. The pharmaceutical composition comprises an agent that will induce an immune response against an amyloid component, or an antibody or antibody fragment that binds to an amyloid component. The invention also relates to a method for determining the prognosis of a patient undergoing treatment for an amyloid disorder which involves measuring a patient serum amount of immunoreactivity against a component. The serum immunoreactivity control level indicates a control of component. A patient serum immunoreactivity of at least four times a base line serum immunoreactivity control level indicates a prognosis of improved status with respect to the disorder. The control compositions of the invention are useful for treating a wide variety of disorders characterised by amyloid fibril deposition in a patient. Such disorders include Alzheimer's disease characterised by cialet amyloid beta peptide fibril deposits; type 2 diabetes characterised by Cialet amyloid protein peptide (lAPP, amylin) fibrils; reactive systemic amyloidosis and familial amyloid A protein (ApoSSA)); systemic senile amyloidosis and familial amyloid A protein (ApoSSA)); systemic senile concephalopathies (e.g. Creutzfeld-Jakob disease, Kuru) characterised by conception protein deposits, and beta-2-microglobulin deposits which form as a create concephalopathies of long term haemodialay energement. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to abeta, the antibody binds to an amyloid deposit and induces a clearing response (For receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to compositions for stimulating the immune system and for treating malignancies associated with overexpression of the HBR-2 proteins. The compositions comprise immunogenic groups of the HBR-2 proteins. The present sequence is one such peptide used in the compositions of the present invention. The compositions can be used for treating cancer, e.g. breast, ovarian, lung, prostate and colon cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Compositions comprising polypeptides and polynucleotides for stimulating the immune system and for treating malignancies associated with overexpression of the HER-2 protein.
                                                This invention describes a novel method of preventing or treating a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a bispecific molecule (I) comprising specific binding sites for an Fealpha receptor and an epidermal growth factor (EGF) receptor. It also provides bispecific molecule (II) comprising a human antibody, preferably a single chain antibody, specific for an Fealpha receptor inked to EGF; a bispecific molecule (III) comprising appecific binding sites for an Fealpha receptor and a HRSZ receptor; (3) a multispecific molecule (IV) comprising specific binding sites for Fealpha receptor and EGF receptor; (4) a multispecific molecule (V) comprising a human antibody specific for an Fealpha receptor, a human antibody specific for an Fealpha receptor, a human antibody specific for an HRSZ receptor, and EGF. (I)-(V) can be used for inducing effector cell killing of tumour cells. The molecules can be used to treat or revent viral, protezoal, or fungal infections, or autoimmune diseases such as immune thrombocytopenia purpura and systemic lupus erythemmans.
                                                                                                                                                                                                                                                                                                                      Fcalpha receptor; epidermal growth factor; EGF; HER2 receptor; tumour; immune thrombocytopenia purpura; systemic lupus erythematosus; vaccine; cytostatic; antiviral; protoxoacide; antifungal; immunosuppressive; antiniflammatory; dermatological; hemostatic; tetanus toxoid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bispecific molecule comprising specific binding sites for an Fc-alpha receptor and an epidermal growth factor, used to induce effector cell killing of tumor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of the promiseuous tetanus toxic T-cell epitope P30. It is an object of the invention to produce a recombinant therapeutic vaccine capable of effecting down-regulation of growth differentiation factor 8 (GDF-8) in order to increase the muscle growth differentiation factor 8 (GDF-8) in order to increase the muscle growth cate of farm animals. Variants of GDF-8 (see AAB20145-53) are provided that are capable of breaking autotolerance against autologous GDF-8.

These comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as the comprise the C-terminal portion of the pitope such as the comprise the C-terminal region limits the possible sites in which the T-cell epitope can be positioned without major disturbance of the comprise of the animals bounced part of an order of the animals. Downer of GDF-8 variants can be used for genetic immunisation of the animals. Downer of the increase muscle mass by up to at least comparation of GDF-8 activity can increase muscle mass by up to at least comparation of GDF-9 activity can increase muscle mass by up to at least comparation of GDF-9 and diditives. Anti-GDF8 vaccines can be used to treat human diseases such as cancer cachexia where muscle atrophy is pronounced and for patients suffering from acute and chronic heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.
                                                                                                                                                                                                                                                                                                                                                         Tetanus toxin, T-cell epitope, growth differentiation factor 8, GDP-8, myostatin; down-regulation; vaccine; muscle; meat; cachexia; cardiant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

```
The invention relates to a new method for inducing killing of a tumor cell which expresses HER 2/neu or epidermal growth factor receptor (EEFR). The method comprises contacting the tumor cell with a multispecific protein comprising a component, preferably an antibody, which binds to an FC receptor (FCR), Her 2/neu or EGFR. The method is useful for inducing killing of a tumor cell from breast cancer, sarcoma, carcinoma, or ovarian cancer. Specific multispecific proteins can also be administered to a subject to treat or prevent other diseases or conditions, including pathogenic infections (e.g., viral (such as HIV)), protozoan infections (such as Toxoplasma gondii), fungal infections (such as acandidiasis), and an autoimmunity (e.g. immune thrombocytopenia purpura and systemic lupus). The present sequence represents an universal tetanus toxin Th epitope TT947-967

The invention relates to an immunogen comprising at least one first antigenic determinant that includes at least one B-cell epitope and/or at least one eyetoxic Tlymphocyte (CTL) epitope, and at least one second antigenic determinant that includes a T helper cell epitope (TH epitope), where each of the first and second antigenic determinants are coupled to an activated polyhdroxypolymer carrier. The invention also relates to an immunogenic composition for raising an immunogen or immunogenic composition in a mammal, including a human. The immunogen or immunogenic composition contained in a virtual lymph node (VLN) device is useful for immunising an animal, including a human, againet an antigen of choice, where the antigen shares at least one first antigenic determinant with the immunogen. This sequence represents a T helper cell epitope used in synthesis of an immunogen of the invention
                                                                                                                                                                                                                                                        Novel immunogen useful for immunizing an animal, has an activated polyhydroxypolymer backbone to which is attached an antigenic determinant including a B cell epitope and another determinant including a T-helper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gonadotrophin releasing hormone; GnRH; synthetic immunogen;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to recombinant multivalent proteins (I) that

stimulate an immune response to Plasmodium vivax. (I) comprises antigenic

determinants, fragments or conservative substitutions, derived from more

than one stage in a life cycle of a Plasmodium vivax parasite. (I) is

useful as a vaccine for stimulating an immune response, specifically a

protective immune response that confers increased resistance to infection

by Plasmodium parasites, such as P. vivax. (I) is especially useful in

the treatment, prevention and reduction of malarial infection, as

c the treatment, prevention and reduction of Plasmodium species

in a biological sample, and for conferring immunity against multiple

stages of the malarial parasite. The antibodies produced are useful for

the detection or measurement of antigenic epitopes derived from one or

more stages in a life cycle of a parasite, particularly P. vivax. The

vaccine comprising the recombinant proteins, is cost-effective, health-

promoting intervention for controlling, preventing or treating the

content of a P30 epitope, a component of the multivalent and multistage

proteins vivacip and vivaczp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                          epitope P30. The invention provides methods for compositions for combatting diseases characterised by deposition of amyloid, such as Alzaeimer's disease. Immunisation is preferably effected by administration of analogues of autologous amyloid precursor protein (APPP) or beta amyloid (Abeta), the analogues being capable of inducing antibody production against the autologous amyloidogenic polypeptides. Especially preferred as an immunogen is autologous Abeta which has been medified by introduction of no or a few foreign, immunodominant and promiscuous Teell epitopes, such as tetanus toxoid P30 epitope. Genetic immunisation against APP or Abeta and vaccination using live vaccines are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a synthetic chimeric fimbrin peptide. The peptide is useful for treating a non-typable Haemophilus influenzae (NTH1) infection and otitis media. The synthetic peptides do not require tedious purification techniques. The present sequence represents the amino acid sequence of a Clostridium tetani T-cell epitope #4.
toxoid T-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to inducing an immune response against autologous carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCS) in the animal of at least 1 modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a tetanus toxoid (TT) P30 epitope that can be introduced into a CEA polypeptide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                     Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a nucleic acid encoding the polypeptide, or a microorganism expressing the
                                                        presenting cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TWF, TWFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a tetanus toxoid epitope peptide. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ø
                                                                                                                                                                                                                                                                     Multimeric protein; interleukin 5; IL5; TNPalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; epitope;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New immunogenic analogue of a polymeric protein, useful for preparing composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                      ð
                                                                                                                                                              The present sequence is that of a universal T-cell epitope comprising amino acids 947-967 of tetanus toxoid. Universal T-cell epitopes such as this can be used as carriers of peptide agents of the invention that bind alpha-4 integrin or a dimer comprising an alpha-4 integrin subunit.

Linkage to a carrier will improve the immune response to a peptide that may be too small to be immunogenic on its own. A method of chronically reducing a patient's pathological inflammation involves administration of an agent that specifically binds to an alpha-4 integrin. The agent is administration of an agent of months, preferably at least 12 months. The administration maintains alpha-4 integrin receptor saturation to chronically suppress pathological inflammation in the patient. The pathological inflammation in the patient. The pathological inflammation is caused by inflammatory disease of the gastrointestinal tract, such as crohn's disease, ulcerative collisis or inflammatory bowel disease, or is

                                                                                                                                                       The invention relates to a synthetic chimaeric fimbrin peptide LB1 or LB2 comprises a first peptide unit derived from H. influenzae fimbrin, a second peptide unit containing a T cell epitope and a third linker peptide which connects the first peptide to the second. The chimaeric peptide is useful for inducing an immune response in animals against nontypable Haemophilus influenzae (NTHi) and for preventing or reducing adherence of NTHi to host cells thereby preventing or reducing the severity of otitis media. The present sequence is a clostridium tetani T cell epitope for use in the chimaeric peptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for reducing pain or increasing the threshold for nociception in an individual comprising administering an agent capable of inducting an active immune response that trargets the individual's autologous tumour necrosis factor alpha (TNFalpha). The agent has analgesic activity, and can be used in a vaccine against autologous TNFalpha. The method is useful in reducing pain or increasing the threshold for nociception in individual. The method is especially intended for reducing neuropathic pain. The present sequence represents
peptide unit and third linker reducing severity of otitis media.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Reducing pain or increasing the threshold for nociception in an individual comprises administering an agent capable of inducing an activimmune response that targets the individual's autologous tumor necrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pain reduction; nociceptive; nociceptor; immune response; tumour necrosis factor alpha; TNFalpha; analgesic; vaccine; pain; neuropathic pain; tetanus toxoid; epitope.

The invention relates to a process for selecting ligands (A) of HLA (human leukocyte antigen)-DP4 comprising: (a) incubating purified DP4 with a labelled peptide (I) in presence of different concentrations of test compounds; (b) separating complexes formed; (c) determining DP4-(I) complexes by measuring a signal from the label; and (d) selecting compounds having binding ICSO less than 1000 nM, corresponding to the concentration required to inhibit 50 % binding of (I). (I) has signal-to-noise ratio over 5, at 10 nM, in a direct binding test to DP4. (A) cause concentration over 5, at 10 nM, in a direct binding test to DP4. (A) cause them, are useful as immunomodulators, including uses in vaccines against pathogens and tumor cells, also for treating autoimmune diseases (multiple sclerosis and type I diabetes), allergy and graft rejection. (A) are useful as reagents for diagnosing the immune status of an individual, while labelled complexes of DP4 with (A) are used to select antigen-specific CD4+ T cells. The method identifies ligands specific for HLA-DP4 and allows exact definition of the binding motif shared by DP4 chinding ligands. This sequence represents an example of a peptide ligand of the invention. The peptides are labelled (biotinylated) at their N-
                                                                                                                            ó;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
tetanus toxoid P30 epitope, which is given in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to antigenic peptides derived from tumour suppressor protein WTI which induce HLA-A24 restricted cytotoxic T-lymbhocytes. The peptides can be used in the preparation of cancer vaccine for treatment and prevention of cancer, including leukaemia, multiple myeloma, lymphoma, and cancer of the stomach, colon, breast, liver, ovary, skin, pancreas, prostate and womb. The present sequence is a polypeptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antigenic peptides derived from WT1 which induce HLA-A24 restricted cytotoxic T-lymphocytes for production of cancer vaccine and treatment

This invention relates to a novel immunogenic composition comprising an ILL-13 (interleukin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human companient of the present invention describes human chimeric IL-13 immunogen formulated in an appropriate manner to generate a having a similar conformational shape to native human IL-13 while having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This peptide compositions of the immunocent is a T-cell peptide epitope fused to IL-13 to create an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune IL-13 (interleukin-13) element that is capable of driving an immune cesponse by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 while having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatchogical and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatchis. This peptide entremed an antiasthmatic activities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition comprises an immunogen that is capable of generating an immunos response against self interleukin-13 [L-13) and an adjuvant composition comprising a combination of an immunostimulatory oligonucleotide containing at least one unmethylated CG motif and a saponin. The IL-13 immunogen is preferably a human IL-13 supplemented with foreign T-helper epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, contact allergies or dermatitis. The present sequence represents a heterologous T-cell epitope which may be incorporated into an IL-13 immunogen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ghrelin, autologous ghrelin, ghrelin analogue; immunogen; immunisation; anti-ghrelin antibody; obesity; anorexia; cachexia; wound; burn; adjuvant therapy; in vitro fertilisation; ghrelin-related cancer; ghrelin receptor-related cancer; anorectic; cytostatic; metabolic; immunomodulator; vulnerary; vaccine; tetanus toxin; P30 epitope;

The invention relates to a method for immunising animals (including humans) against autologous givelin. The method involves presenting ghrelin (or sub-sequence thereof) or a phrelin analogue comprising a ghrelin B-cell epitope and non-ghrelin chemical moieties to the immune system, thereby inducing the production of antibodies against the animal autologous ghrelin. The invention laso relates to immunogenic compositions comprising ghrelin. The invention also relates to immunogenic compositions comprising ghrelin, a nucleic acid encoding a ghrelin analogue of the invention; a nucleic acid encoding a ghrelin analogue of the invention; vectors and host cells comprising this nucleic acid; a method of identifying a modified ghrelin polypeptide capable of inducing a method of the invention. The method of the invention is useful for treating, preventing or ameliorating obseity or other conditions treating, preventing or ameliorating obseity or other conditions contacting that that the total amount of body fat is significantly decreased. The method may also be used for upregulating ghrelin for treatment, prevention or amelioration of anotaxia or cachaxia. The method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                may also be used for treating wound or burns, in adjuvant therapy for in vitro fertitilisation, and for treating ghtelin and ghrelin-receptor related cancers. The present sequence represents the tetanus toxin P30 epitope, a promiscuous T-cell epitope, which may be used in ghrelin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                Immunizing against autologous ghrelin in animals e.g. human beings, useful for treating obesity, by presenting ghrelin polypeptide, its subsequence or analog, to animal's immune system, for producing antibodies against ghreling

Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or beta-amyloid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antiparkinsonian; antibody therapy; Lewy body; alpha-symuclein; aggregation; brain; immunogenic response; beta-amyloid;

The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to amino acids 947-967 of the tetanus toxoid protein used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes WII substitution peptides, in which a cysteine residue is substituted with another amino acid residue. The WII substitution peptides have CTL induction activity. Peptides of the invention are used in cancer vaccines, which are applicable in the treatment of e.g. stomach cancer, prostate cancer and ovarian cancer. The present peptide represents a peptide that is mentioned in the
                                                                                                                                                                                                                                                                                                                                                                                        Novel WTI substitution peptides with cysteine replaced by specific amino acid residue and their encoded polynucleotide for cancer vaccines with CTL induction activity for treatment of e.g. stomach cancer and prostate

```

The invention relates to a method of preventing (MI) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (MI) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response

Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or

The international dendrimer (D) conjugate having aspecific structure arabohydrate dendrimer (D) conjugate having a specific structure containing a functional dendrimer, a residue of a carbohydrate, and a residue of an immunomodulating substance. (CD) is useful in the production of antibodies, as a targeting compound, in medicine, in inhibition of bacterial adhesion, inhibition of toxin action such as e.g. glycosphingolipid-specific VT2 toxins and other such bacterial toxins with binding activities toward cell-surface carbohydrates of the host, or inhibition of carbohydrate-mediated virus entry into host cells, in diapostic assays, in assays for the detection of antibodies against E, and in high-throughput screening. (CD) are useful for treating and/or preventing bacterial diseases such as e.g. infection with bacteria, viral diseases such as infection with HIV, hepatitis or influenza, fungal diseases and certain types of cancer such as carcinomas or melanomas. The method enables fast and efficient synthesis of dendrimer conjugates to having a well-defined chemical structure. This sequence corresponds to a
                                                                                                                                                                                                                                                       ö
against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphapynuclein aggregation. This sequence corresponds to the tetanus toxoid peptide corresponding to amino acid 947-967 used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antibacterial; virucide; fungicide; hepatotropic; anti-HIV; cytostatic; vaccine; bacterial adhesion inhibitor; toxin action inhibitor; carbohydrate dendrimer; immunomodulating substance; HIV; hepatitis; influenza; fungal disease; cancer; carcinoma; melanoma; poliovirus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel method of generating a population of T-cells specific for an antigen comprising isolating a population of substantially mature antigen presenting cells (APC), co-incubating the substantially mature APC population with a population of CD4+ T-cells and a target antigen for a time and under conditions sufficient to generate CD5+ T-cells specific for the antigen. The method of the invention has virucide, antibacterial, protozoacide, and cytostatic activity, and may have a use in cell therapy. The present sequence represents tetanus toxoid p30 peptide (t1947-967).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Generating a population of T-cells specific for an antigen comprises co-
incubating the substantially mature APC population with a population of
CD4+ T-cells, a population of CDS+ T-cells and a target antigen.
                                                                                                                                                                                                                                                                                                                          T-cell; antigen; antigen presenting cell; APC; CD4+; CDS+; virucide; antibacterial; protozoacide; cytostatic; cell therapy; tetanus toxoid;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                   Gaps
tetanus toxoid peptide sequence used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel chimeric binding protein that is immunogenic in an animal. The chieric binding protein binds specifically to a first receptor that binds a second receptor present in an antigen of the animal, where the chimeric binding protein structure, autologous in the form of a binding site; a scaffold protein structure, autologous in the mammal, that stabilizes the 3D conformation of the binding site; and at least one tolerance breaking amino acid sequence, which is the teast one tolerance breaking amino acid sequence, which is the teast one tolerance breaking amino acid sequence, which is the teast one tolerance breaking amino acid sequence, which is the comprises; a nucleic acid fragment that encodes the chimeric binding protein; a vector carrying the nucleic acid fragment; a transformed cell carrying the vector; a composition for inducing production of antibodies against an antigen in the autologous host comprising the chimeric binding protein in a carling an explosive of the self-antigen in an animal. The chimeric binding protein has cytostatic activity. The chimeric binding protein is useful in preparing a vaccine against e.g. cancer. This sequence represents a 'promiscuous' T-H tetanus toxoid epitope peptide for use in the vaccine of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New chimeric binding protein comprising a B-cell epitope, a scaffold protein structure and a tolerance breaking amino acid sequence, useful in preparing a vaccine against e.g. cancer.
                                                                                                                                                          chimeric binding protein; immunogenic; B-cell epitope; Bcaffold protein structure; major histocompatibility complex; MHC; Class II; cytostatic; vaccine; cancer; promiscuous; tetanus toxoid;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 100.0%; Score 112; DB 8; Length 21; Similarity 100.0%; Pred. This invention relates to novel mutant peptides derived from SYT-SSX. Specifically, it refers to a peptide SS393, which is a modified tumour antigen peptide that can be used as the active ingredient in a cancer vaccine. The present invention describes the development of mutant peptides that exhibit increased binding affinity to the HLA-A24 antigen, and as such have a favourable cytotoxic lymphocyte (CTL) induction activity. Accordingly, these peptide epitopes can be used to treat patients suffering from various tumours including synovial sarcoma, and furthermore they exhibit cytostatic activities. This peptide sequence is a helper peptide derived from the tetanus toxin, given in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease.

                                                                                                                                                         This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein ARPP Meta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (For receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta, or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The Alzheimer's disease
                                                                                                Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Preventing or treating disease such as Parkinson's disease characterized
